Primitive TypeScript Types

string

number

boolean

```
let variable_name: type_name;
```

Function Types

```
function fn_name(param1: type, param2: type): type { }
```

function parameters

return type

Arrays

```
let variable_name: type_name[];
```

alternate form

```
let variable_name: Array<type_name>;
```

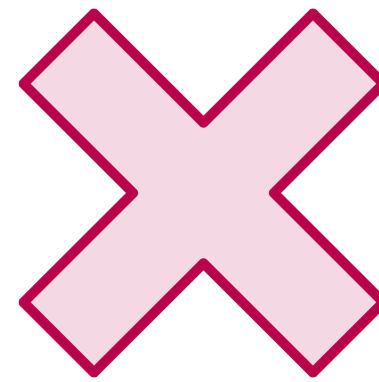

The any Type

```
let variable_name: any;
```

Use The unknown Type Instead of any

```
let variable_name: any;
```

```
let variable_name: unknown;
```

Interfaces

```
interface InterfaceName {  
    property1: type_name;  
    property2: type_name;  
    method(): type_name;  
}
```

Structural Typing

```
interface Book {  
  title: string;  
  publishedYear: number;  
}
```

```
let aBook = { title: "The Time Machine", publishedYear: 1895 };
```

It looks like a Book
